

AdaPoinTr Y-up r2: fixed output density changes coverage and physical errors

75 development Actors / 5 independent logs; bars = equal log means, dots = individual logs

Matched: min(build points, 1024) + 512 patches. Full density: 16,384 patches per nonempty Actor. Same 0.06 m PCA patch scale.
Fixed saved outputs, no retraining. Density sensitivity is separate from matched-budget comparisons; sparse targets do not define complete surface precision.
