

Q-v2 fixed-mesh diagnosis: support location remains the joint bottleneck

Most joint early rays have no later correct support

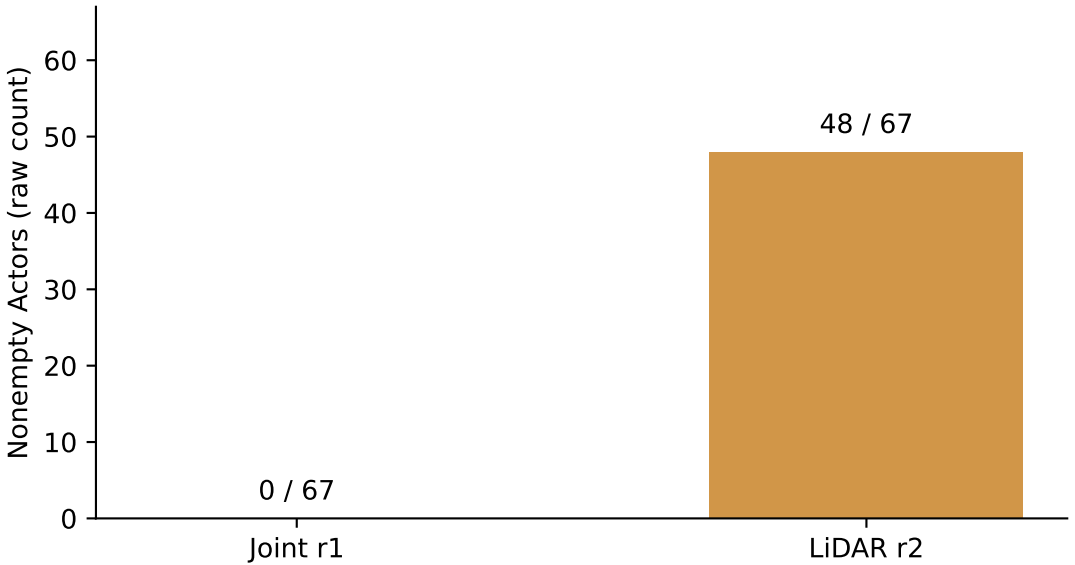

Correct first hit Early; near target, no ray hit Late; near target Missing; near target
Early; later correct support Early; no correct or near support Late; no near target Missing; no near target

Local deformation relative to analytic template

Detected nonadjacent triangle intersections

75 DEV Actors / 5 logs; 8 empty meshes retain missing predictions but have no distortion statistic.
Template is not ground truth. Intersection test skips pairs sharing any vertex; zero detections do not certify no folding.
Saved meshes only. No neural inference, mesh edits, new data, or repeated LiDAR ray queries.
